

Figure 1. The Photos of TEC15M5V3AD

FEATURES

- Compact Size: 0.59"×0.59"×0.15" (15.0mm×15.0mm×3.8mm)
- Small Height: 0.15" (3.8mm)
- High Reliability
- Efficiency: 90%
- Maximum Output Current: 3A
- Maximum Output Voltage: 5V
- Actual Object Temperature Monitoring
- High Stability: 0.01°
- Zero EMI
- Low Cost
- 100 % lead (Pb)-free and RoHS compliant

DESCRIPTION

The TEC15M5V3AD is a highly integrated TEC controller designed for driving TECs (Thermo-Electric Coolers) with high stability in regulating the object temperature, high reliability, and compact size. Figure 1 is the photos of TEC15M5V3AD.

The module provides interface components for users to configure desired object temperature range, i.e. set-point temperature range; maximum voltage across TEC, i.e. maximum TEC voltage; and the compensation network. The compensation network compensates the high order thermal load and thus stabilizes the temperature control loop.

It provides these functions: thermistor T-R curve linearization, temperature measurement and monitoring, temperature control loop status indication, TEC voltage monitoring, power up delay, and shut down.

The TEC15M5V3AD comes with a high stability low noise 2.5V voltage reference which can be used for setting the desired object temperature by using a POT (Potentiometer) or a DAC (Digital to Analog Converter). When using this reference for setting the set-point temperature, the set-point temperature error is independent of this reference voltage. This is because the internal temperature measurement network also uses this voltage as the reference, the errors in setting the temperature and measuring the temperature cancel with each other, setting the object temperature with higher stability. This reference can also be utilized by an ADC (Analog to Digital Converter), for the same reason, the measurement error will also be independent of the reference voltage, resulting in a more accurate measurement.

Figure 1 is the photos of TEC15M5V3AD controller. Figure 2 is the real size top view of the controller showing the pin names and locations with the actual size. The pin functions are shown in Table 1.

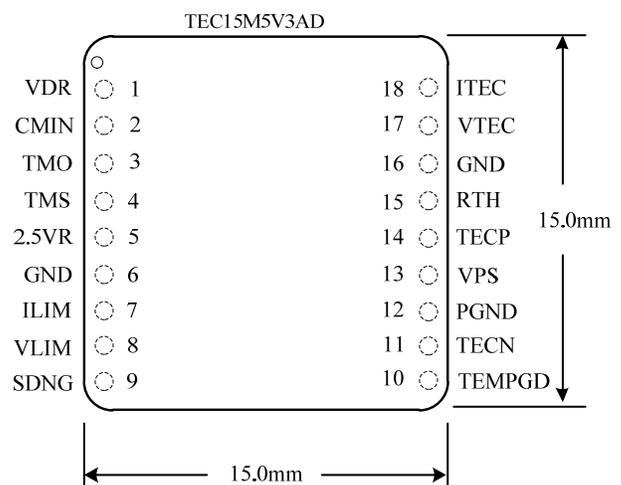

Figure 2. Pin Names and Locations

SPECIFICATIONS

Table 1. Pin Function Descriptions

Pin #	Pin Name	Type	Description
1	VDR	Analog Output	When V_{VDR} is $< 0.5V_{REF}$, it is in cooling mode; when V_{VDR} is $> 0.5V_{REF}$, it is in heating mode.
2	CMIN	Analog Input	Compensation input pin for the thermal control loop. Leave it open in production.
3	TMO	Analog Output	Actual object temperature. 0.1V to 2.5V indicates the default temperature network from 15°C to 35°C.
4	TMS	Analog Input	Object set-point temperature input port. It is internally tied by a 500k resistor to the half value of the reference voltage, 1.25V. The open circuit voltage of this pin is thus 1.25V, corresponding to a set-point temperature of 25°C by using the default temperature network (with the set-point temperature range being from 15°C to 35°C). It is highly recommended to set this pin's voltage by using the controller's voltage reference. The lower limit of the setting voltage for this pin is 0.1V. Setting this pin to a $< 0.1V$ voltage may cause the controller over cooling the object.
5	2.5VR	Analog Output	2.5V Reference Output.
6	GND	Ground	Signal ground for the POT, ADC, DAC and the thermistor.
7	ILIM	Analog Input	Current Limit. This pin sets the TEC cooling and heating current limits. $V_{ILIM_HEATING} = 2.5V \times R2 / (R1 + R2)$ $V_{ILIM_COOLING} = V_{ILIM_HEATING} + 40 \times R1 \parallel R2$ $I_{TEC_MAX_COOLING} = (V_{ILIM_COOLING} - 1.25V) / 0.285$ $I_{TEC_MAX_HEATING} = (1.25V - V_{ILIM_HEATING}) / 0.285$ $V_{ILIM_HEATING}$ must not exceed 1.2V and $V_{ILIM_COOLING}$ must be more than 1.3V to leave proper margins between the heating and the cooling modes.
8	VLIM	Analog Output	Voltage Limit. This pin sets the TEC cooling and heating voltage limits. $V_{VLIM_COOLING} = 2.5V \times Rb / (Ra + Rb)$ $V_{VLIM_HEATING} = V_{VLIM_COOLING} - 10\mu A \times Ra \parallel Rb$ $V_{TEC_MAX_COOLING} = V_{VLIM_COOLING} \times 2V$ $V_{TEC_MAX_HEATING} = V_{VLIM_HEATING} \times 2V$
9	SDNG	Both Analog Input and Output	Shutdown/Temperature good. When this pin is pulled low, the device shuts down. If this pin is left unconnected: When the actual temperature is lower than the preset temperature, the output voltage is $0.5V_{VPS}$; when the actual temperature reaches the preset one, the output voltage is V_{VPS} .
10	TEMPGD	Digital Output	Temperature good indication.
11	TECN	Analog Power Output	Connects to TEC negative terminal
12	PGND	Power Ground	Power ground for connecting to the power supply
13	VPS	Power Input	Positive power supply rail. The value is 5V.
14	TECP	Analog Power Output	Connects to TEC positive terminal

15	RTH	Analog Input	Connect to the thermistor for sensing the desired object temp. Thermistor's other end connects to the signal ground, pin 2. Rth = 10kΩ@25°C. Other thermistors or temperature sensors can also be used, consult with us. See Figure 4 for the connection.
16	GND	Ground	Signal ground for the POT, ADC, DAC and the thermistor.
17	VTEC	Analog Output	TEC voltage indication.
18	ITEC	Analog Output	TEC current output. $I_{TEC} = (V_{ITEC} - 1.25)/0.285$, where I_{TEC} is the TEC current, defined as the current flowing into the positive TEC terminal (TEC+) and out of the negative TEC terminal (TEC-).

Table 2. Characteristics (T_{ambient}=25°C)

Parameter	Test Condition	Value	Unit/Note
Object* temp. stability vs. ambient temp	V _{VPS} =5V, R _{load} =1.2Ω	0.0002	°C/°C
Object temp. vs. set-point. offset	T _{ambient} is 0 ~ 50°C, set-point temp. is 15°C ~ 35°C	±0.1°C or ±15mV	
Object temp. response time	≤0.1 to the set-point temperature at a 1°C step	<5	seconds
Efficiency	V _{VPS} =5V, R _{load} =3.2Ω	≥90%	-
Max. output current	V _{VPS} =5V, R _{load} =3.2Ω	3	A
Max. output voltage	V _{VPS} =5V, R _{load} =3.2Ω	0 ~ (V _{VPS} - 0.2)	V
PWM frequency		2	MHz
Power supply voltage	—	4.75 ~ 5.25 (typically 5)	V
Set-point temp.** control voltage	V _{VPS} =5V, R _{load} =3.2Ω	0.1 ~ 2.5	V
Default set-point temp. range***	V _{VPS} =3V	15 ~ 35	°C
Operating temp. range	V _{VPS} =5V, R _{load} =3.2Ω	-40 ~ 85	°C
Storage temp. range		-55 ~ 125	°C

* Object temperature refers to the actual cold side temperature of the TEC, on which the target is mounted.

** Set-point temperature is the temperature desired to have on the target.

*** Can be customized to any range according to the requirement.

Note: 1. This TEC controller can only drive the TECs having > 1Ω impedance, which equals V_{MAX}/I_{MAX}.

2. After many experiments, according to the parameter and the figuring method of R_{load}, we advise to use R_{load}=3.2Ω.

BLOCK DIAGRAM

The block diagram of the controller is shown in Figure 3.

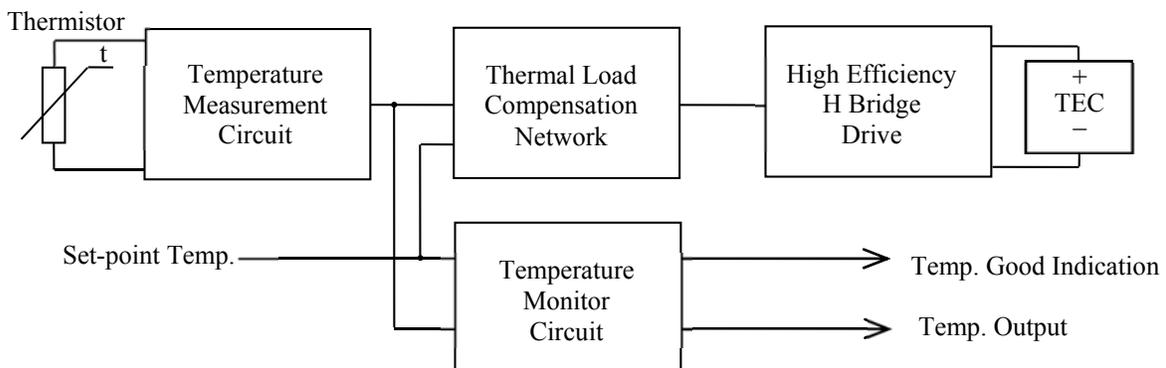

Figure 3. TEC Controller Block Diagram

APPLICATIONS

TEC controller connections are shown in Figure 4.

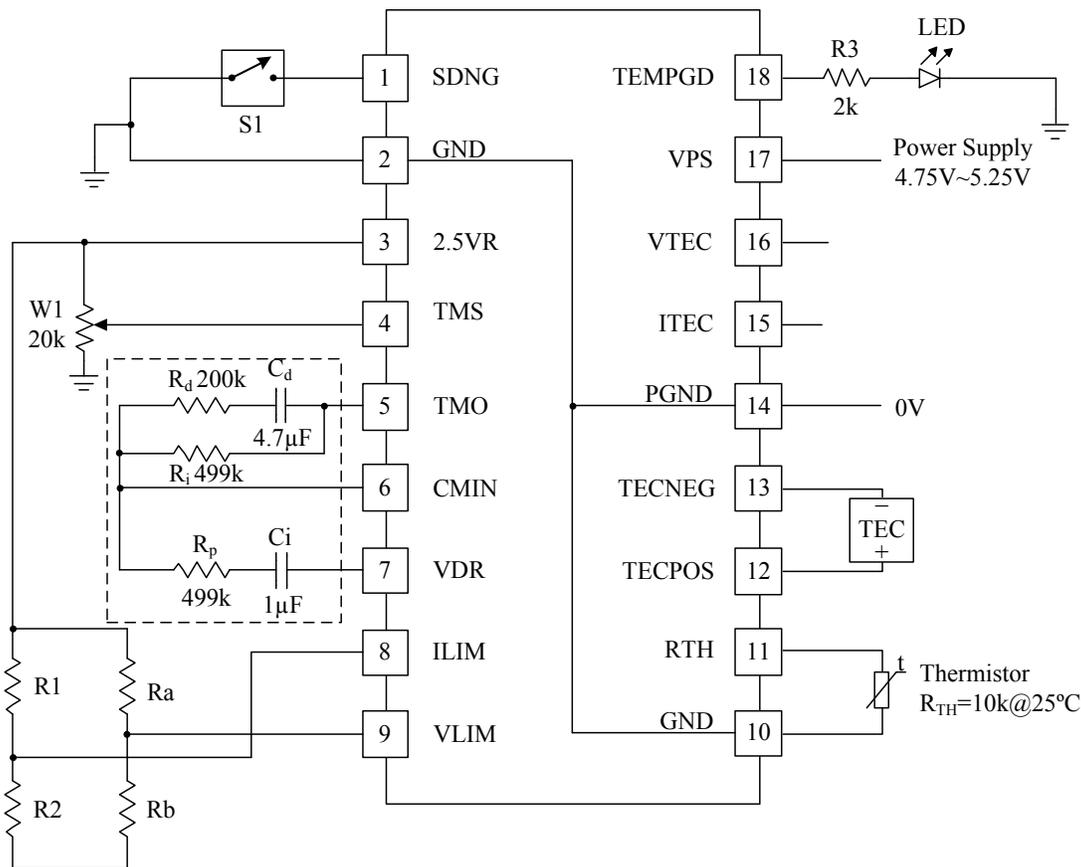

Figure 4. TEC Controller Connections

If you want to use this TEC controller for other applications not discussed here, such as using it with wave locker controllers, please consult us. The same as to other customizations, such as setting the TMS by using a voltage source swings above 2.5V and/or VPS.

This controller comes with a default temperature setting network, it sets the set-point temperature to be between 15°C to 35°C when setting the TMS pin voltage to be between 0V to 3V linearly and using a specific de-facto “standard” 10k @ 25°C thermistor. When using different thermistors and/or needing different set-point temperature ranges, please contact us, we will configure the internal temperature network for you.

Note: This TEC controller doesn’t come with an internal compensation network and we don’t recommend using internal compensation network either. The compensation network is made of 5 components: 3 resistors and 2 capacitors and the values of the components in the network are the default values shown in Figure 4. Implementing the network externally is highly recommended since it can be modified for driving different thermal load and/or the thermal load characteristics is not certain or fixed at the early design stage.

MECHANICAL DIMENSIONS

The controller comes in DIP package. Dimensions of the TEC15M5V3AD is shown in Figure 5. A recommended PCB layout is shown in Figure 6.

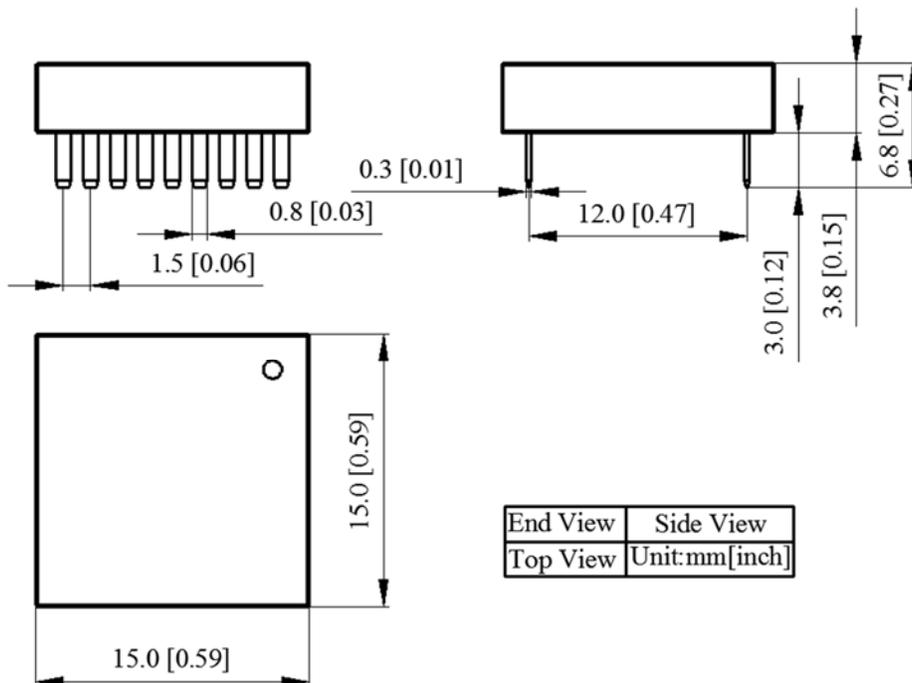

Figure 5. Dimensions of the TEC15M5V3AD

(PCB Board Tolerance ± 0.05)

Unit: mm[inch]

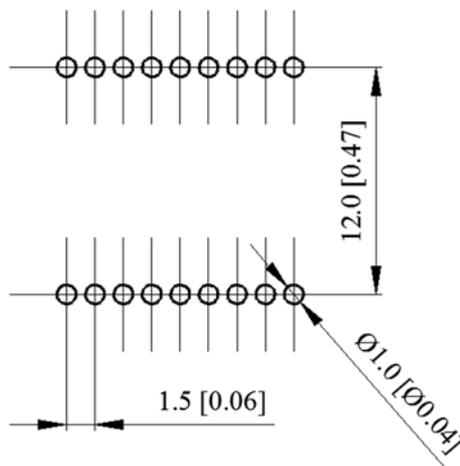

Figure 6. Recommended PCB Layout (Top Side)

NOTE: The power supply may have overshoot, when happens, it may exceed the maximum allowed input voltage, 6V, of the controller and damage the controller permanently. To avoid this from happening, do the followings:

1. Connect the controller solid well with the power supply before turning on the power.
2. Make sure that the power supply has sufficient output current. It is suggested that the power supply can supply 1.2 to 1.5 times the maximum current the controller requires.
3. When using a bench top power supply, set the current limit to >1.5 times higher than the maximum current the controller requires.

NOTICE

1. ATI warrants performance of its products for one year to the specifications applicable at the time of sale, except for those being damaged by excessive abuse. Products found not meeting the specifications within one year from the date of sale can be exchanged free of charge.
2. ATI reserves the right to make changes to its products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete.
3. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability. Testing and other quality control techniques are utilized to the extent ATI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.
4. Customers are responsible for their applications using ATI components. In order to minimize risks associated with the customers' applications, adequate design and operating safeguards must be provided by the customers to minimize inherent or procedural hazards. ATI assumes no liability for applications assistance or customer product design.
5. ATI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of ATI covering or relating to any combination, machine, or process in which such products or services might be or are used. ATI's publication of information regarding any third party's products or services does not constitute ATI's approval, warranty or endorsement thereof.
6. IP (Intellectual Property) Ownership: ATI retains the ownership of full rights for special technologies and/or techniques embedded in its products, the designs for mechanics, optics, plus all modifications, improvements, and inventions made by ATI for its products and/or projects.
