# Analog Technologies

Figure 1. AQCL1A410SE

## FEATURES

Input Voltage Range:  $10V \sim 28V$ Output Voltage Range:  $1V \sim V_{VPS} - 4V$ Maximum Output Current: 1AUltra Low Noise:  $1.25\mu A_{P-P}@0.1Hz \sim 10Hz$ Input Voltage Polarity Reverse Protection Under-Voltage Protection Current Limit Over-Temperature Protection High Absolute Accuracy: <0.1% @ 0°C~50°C ambient temperature

High Stability: <20ppm/°C

Control Loop Good Indication: LPGD

Output Current Real Time Monitoring: LIO

Complete Shielding

Compact Size: 49.4mm(L)×45mm(W)×14mm(H)

100 % Lead (Pb)-Free and RoHS Compliant

#### APPLICATIONS

This QCL driver can be used to drive QCLs (Quantum Cascade Laser) for radar, medical diagnostics, spectroscopy, chemical analysis, general measurement systems, etc.

## DESCRIPTION

AQCL1A410SE is a quantum cascade laser driver with single ended input control.

The AQCL1A410SE is a chassis mount electronic module designed for driving QCLs. It delivers ultra-low noise current and still preserves a wide modulation bandwidth. The AQCL1A410SE comes with protections for overvoltage, under-voltage, over current, and over temperature.

To monitor the working status of the laser driver, there is a control loop good indication pin, LPGD; and the output current monitor pin, LIO.

Figure 1 shows the physical photo of AQCL1A410SE. The output voltage can swing from 0.5V to  $V_{VPS} - 4V$ , where  $V_{VPS} = V_{OUT} + 5V$ ,  $V_{VPS}$  is the power supply voltage and can be from 10V~28V.

Figure 2 shows the relationship between the output voltage and power supply voltage.

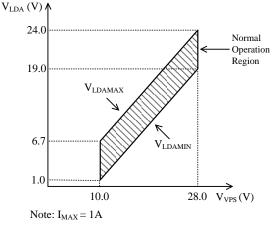

Figure 2. V<sub>VPS</sub> vs. V<sub>LDA</sub>

**QCL Driver with Differential Input Control** 

AQCL100MA410SE

| Pin # | Pin Name | Port Type      | Description   |  |  |  |
|-------|----------|----------------|---|--|--|--|
| 1     | DATA-    | Analog input   | NC  |  |  |  |
| 2     | DATA+    | Analog input   | NC  |  |  |  |
| 3     | 1.2VR    | Analog output  | NC  |  |  |  |
| 4     | GND      | Signal ground  | Signal ground. Connect this pin to the signal ground of ADCs, DACs, and the signal sources.   |  |  |  |
| 5     | LPGD     | Digital output | Loop good indication. When outputting a high logic level 5V, it indicates the control loop works properly, i.e. the output current equals the set-point value; outputting a logic low level indicates there is something wrong in the control loop, such as open circuit, output current equals zero, etc.  |  |  |  |
| 6     | SBDN     | Digital input  | This is a duplex pin: when it is pulled down <0.4V, the controller is put into<br>Shut-down Mode; when setting this pin to between 1.2V to 2.5V, the controller is set to<br>Stand-by Mode. In this mode, the voltage reference is still working; when setting it<br>to >2.64V to VPS voltage, the controller goes to On Mode. There is an internal 20MΩ<br>pull up resistor tied to VPS. |  |  |  |
| 7     | GND      | Signal ground  | Signal ground. Connect this pin to the signal ground of ADCs, DACs, and the signal sources.   |  |  |  |
| 8     | 4VR      | Analog output  | Voltage Reference 4.096V output. It can be used by external POTs (Potentiometer), DACs and/or ADCs for setting the LIS. Under Stand-by Mode, this pin is still working.   |  |  |  |
| 9     | ILM      | Analog input   | Laser current limit set. 0V to 4.096 V sets the laser current limit from 0 to 1A linearly. The internal input impedance is 1M.  |  |  |  |
| 10    | LIS      | Analog input   | Laser current setting indication. 0V to 4.096 V indicates the laser current is set from 0 to 1A linearly.   |  |  |  |
| 11    | LIO      | Analog output  | Laser current output indication. 0V to 4.096 V indicates the laser current from 0 to 1A linearly.   |  |  |  |
| 12    | ТМО      | Analog output  | The controller internal temperature indication output. It can be used for sensing the actual temperature of the controller to avoid over-heating. 0V to 4V represents the controller temperature from $-55^{\circ}$ C to $125^{\circ}$ C.   |  |  |  |

Table 1. Terminal Block Connector 1 Pin Function Descriptions

Table 2. Terminal Block Connector 4 Pin Function Descriptions

| Pin # | Pin Name | Port Type     | Description   |  |  |  |  |
|-------|----------|---------------|---|--|--|--|--|
| 1     | LDA      | Analog output | Laser diode anode. Connect it to the anode of the laser diode.  |  |  |  |  |
| 2     | LDC      | Analog output | log output Laser diode cathode. Connect it to the cathode of the laser diode. This pin is intern connected to PGND and GND, thus its voltage potential is zero. |  |  |  |  |
| 3     | GND      | Signal ground | Signal ground. Connect this pin to the signal ground of ADCs, DACs, and the signal sources.   |  |  |  |  |
| 4     | PGND     | Power ground  | Power ground pin. Connect it directly to power supply return rail.  |  |  |  |  |
| 5     | VPS      | Power input   | Power supply voltage. The driver works from 10V to 28V.   |  |  |  |  |

## Table 5. VLIS & IOUT

| V <sub>LIS</sub> | I <sub>OUT</sub> |
|------------------|------------------|
| 4.096V           | 1A               |
| 2.048V           | 0.5A             |
| 0V               | 0A               |

$$I_{OUT} = \frac{V_{LIS}}{4.096V} \times 1A$$

V<sub>LIS</sub>: The voltage for setting the laser current.

I<sub>OUT</sub>: The output current.

Insert the screwdriver into the upper card slot, and the lower card slot should be inserted with a power cord with a bare core ( $\phi$ =1.5mm ±0.2mm; L=7.5mm ±0.2mm).
